

10 Ways to Save Water

1. Check for broken lines, sprinkler heads and valves
2. Make sure run times on irrigation clocks are correct for plant material and sprinkler types
3. Install rotor type sprinklers (MP Rotators) instead of fixed spray sprinklers
4. Adjust sprinkler head to avoid overspray
5. Install ET based irrigation controllers
6. Irrigate early in the morning to avoid evaporation and increased soaking of soil
7. Check line pressure in irrigation systems to assure sprinklers are operating at desired specifications (avoid misting)
8. Let grass grow a little longer, this will create a shade for the soil below to hold more moisture
9. Run cycle/soak programs on your irrigation controller for those hard to water areas
10. Install check valves on slopes

Ask any of your Grangetto's Sales Representatives about the above tips and many more!!!!!!
